

SONORA DIGITAL TOKEN

Full Technical & Strategic Project Instructions for Hostinger Assistant

1. Project Overview

Sonora Digital Token is a digital infrastructure project designed to modernize enterprise-level supplier, transaction, and operational verification processes through secure tokenization, digital identity validation, and encrypted transaction layers. The system must operate with enterprise-grade reliability, scalability, and security standards appropriate for a company operating at multi-million USD annual revenue scale with national and international suppliers.

2. Core Objectives

- Eliminate operational vulnerabilities from manual or semi-digital workflows. - Implement secure token-based validation for supplier interactions. - Ensure encrypted data storage and secure authentication protocols. - Provide real-time traceability of transactions and digital signatures. - Establish scalable architecture ready for international expansion.

3. System Architecture Requirements

The platform must be built under a modular and scalable architecture using: - Secure backend infrastructure with API-first design. - Role-Based Access Control (RBAC). - Multi-layer authentication (2FA minimum). - End-to-end encryption (TLS 1.3 or higher). - Encrypted database storage. - Audit logs with immutable event tracking. - Cloud-based infrastructure with redundancy.

4. Hosting & Infrastructure Specifications (Hostinger)

- Deploy on high-performance VPS or Cloud Hosting tier. - Enable automatic backups (daily). - Configure SSL certificates (mandatory). - Firewall configuration and DDoS protection. - Dedicated staging environment before production release. - Uptime target: 99.9% minimum.

5. Security & Compliance Requirements

- Data encryption at rest and in transit. - Secure key management policies. - Periodic security patching and updates. - Access logging and anomaly detection. - GDPR-compliant data handling where applicable.

6. Functional Modules Required

- Supplier onboarding & verification module. - Token issuance & validation module. - Transaction tracking dashboard. - Administrative control panel. - Audit reporting system.

7. Scalability & Future-Proofing

The infrastructure must support: - Multi-country deployment. - High concurrency transaction processing. - API integration with ERP systems. - Expansion into blockchain-based validation if required.

8. Operational Governance

- Clear user hierarchy definition. - Separation of privileges (no single point of control). - Backup administrator roles. - Incident response protocol integration.

9. Performance Benchmarks

- Page load < 2 seconds under normal load. - Token validation < 500ms. - System capable of scaling without downtime during traffic spikes.

10. Final Deployment Requirements

- Full system testing in staging. - Security audit before production launch. - Documentation delivery (architecture + admin manual). - Post-launch monitoring setup.
